A Free MSDN Seminar for Developers

All Event Times Are: 1:00PM - 5:00PM

Leveraging Application Blocks in your Application Development

Application blocks are reusable code components from Microsoft for common programming tasks that encapsulate best practices and real-world requirements. We will examine three of these: the Exception Management Application Block that logs exception information to the Windows Event Log; the Configuration Management Application Block that manages configuration data and the Updater Application Blocks that implements a pull-model self-updating capability.

Rapid Application Development features in Visual Studio 2005

Visual Studio 2005, codenamed "Whidbey", contains new features for rapid application development. In this session, we will look at improvements to the Whidbey IDE, the new code snippet - IntelliTask- feature, namespace shortcuts, and language enhancements.

XML, XQuery, and CLR Integration in SQL Server 2005

The next major version of Microsoft SQL Server, codenamed "Yukon", will extend its XML capabilities with a native, full-fledged XML data type, support for the XML Query and XML Schema Definition language standards, and the graphical XQuery Designer tool. We'll demonstrate how Yukon's ability to host the .NET Framework common language runtime will enable stored procedures, triggers and user-defined functions to be written in Visual Basic .NET and C#, and then run in its memory managed, type-safe and secure execution environment.

Introduction to SQL Server 2000 Reporting Services

In this session, you'll see how the Reporting Services integrates with Visual Studio .NET to create and customize reports, and lastly, manage and schedule delivery of updated reports in the Report Manager.
